IBME: a New Brunswick Gem

- Founded in 1965 by Bob Scott to address clinical needs with scientific expertise
- Internationally recognized as a leader in prosthesis research and clinical care

IBME: Clinical care for NB and beyond

- We provide clinical upper-limb prosthetic care for New Brunswick and difficult cases across Atlantic Canada
- We are fortunate to provide services to NB children due solely to the support of philanthropic groups such as War Amps

International research with a local impact

- Our research formed the foundation of international advanced prosthesis control
- Frequently sought in international teams and media
- Research impacts our local clinical care, both in the prosthetics clinic and at the Stan Cassidy Rehabilitation Centre

Looking forward while keeping our roots

- Our scientific advances are fueled by our unique blend of research and clinical care
- Branching out to broader clinical populations (stroke, MS, spinal cord injury)
- Developing new technologies (robotic exoskeletons, outcome measure tool-kits)
- Provincial funding agencies are allowing us to achieve clinical & local commercial impact

Global impact, regional benefit

- Health Technologies is poised to become the next booming industry
 - Chronic disease
 - Healthy aging
- NB has the innovation ecosystem, loyalty, education, and clinical population for success
 - NB Innovation Research Chair in Medical Devices and Technologies
 - Created technology that resulted in first ever commercialization of 'smart' prosthesis controller
 - E5E: IBME spin-off
 - Close relationships with **local** industry (T4G, Excel Manufacturing, SmartSkin, etc...)

What is biomedical research?

What research is

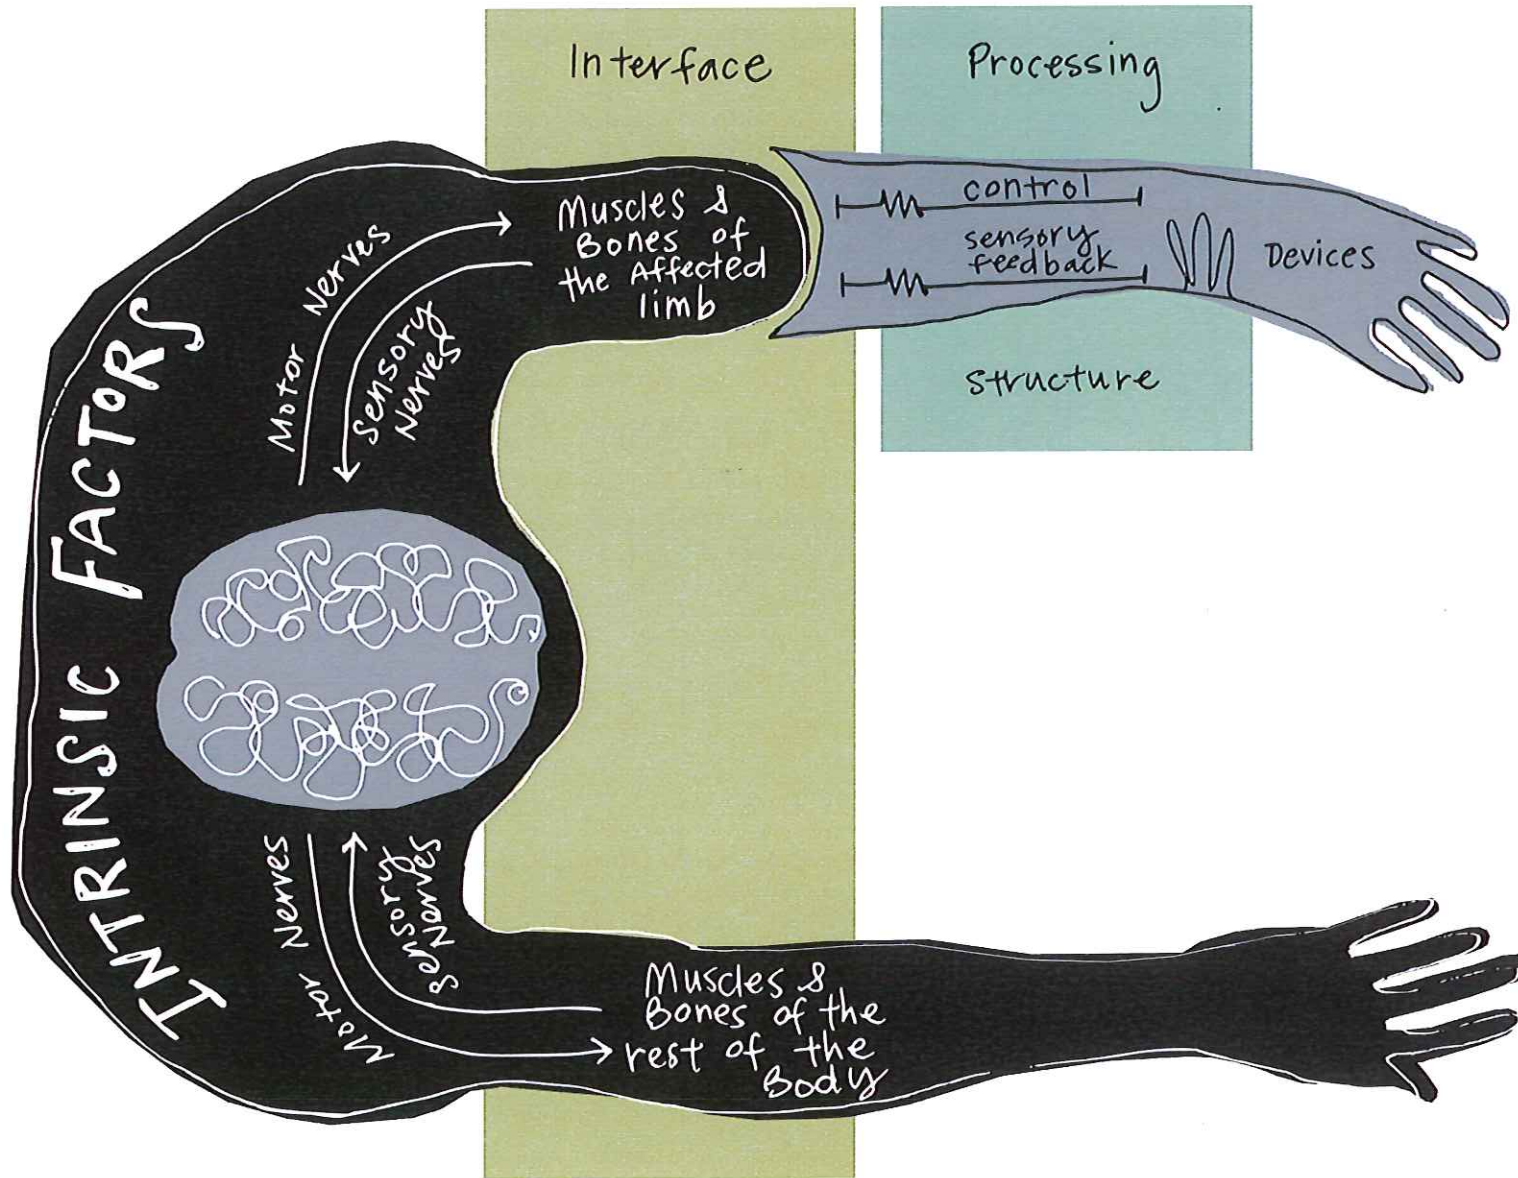

- 2010 3DOF Wrist - folded into 2011 grant
- 2010 DoD device
- 2010 RIC Line item 3
- 2010 VA Actuator
- 2010 VA Ankle
- 2010 XWing
- 2011 Clinical Trial
- 2011 Haptic Box
- 2011 RIC Line item 2
- 2011 TATRC Haptic Box
- 2011 V Decem cycle
- 2012 Purdue Switzer
- 2012 Research Chair
- 2012 SensinG e_NSI
- 2013 NIH R21 Limb lengthener
- 2013_01_14 NU engineer
- 2013_01 SensinG NIH R Leg
- 2013_07 NBHRF Establishment Grant
- 2013_07 NIDRR-C Manig Mobili
- 2013_12_05 VA Adaptable ankle resu...
- 2013_Kuike n TMR
- 2013_PC I
- 2014_09 CFI
- 2014_09 NSERC RTI Englehart
- 2014_12 NBHRF summe stude

- 2016_12 NBHRF summe stude

Biomimicry: *what vs. why*

Prosthesis control is complex

INTRINSIC FACTORS

EXTRINSIC FACTORS

Why are causal models important?

- Things are complicated
- Subjects are few
- Can tap larger knowledge base on able-bodied control theory
- Predictions are often counter-intuitive (but accurate!)

Simple, accurate models

Simple, accurate models

[Useful scientific frameworks] include the relevant data, do so with a certain sort of simplicity, and prove fruitful in areas beyond the immediate concern. ~ N.T. Wright

$$\dot{x} = Ax + Bu$$

$$P = A'PA + Q$$

$$K = \frac{P}{Q + R}$$

$$\dot{x} = \dot{x} + K(\hat{x} - x')$$

$$P = P(I - K)$$

Simple, accurate models

Enable us to:

- Developing quantifiable outcome measures
- Improve control through augmenting feedback
- Better understand human-robot interaction

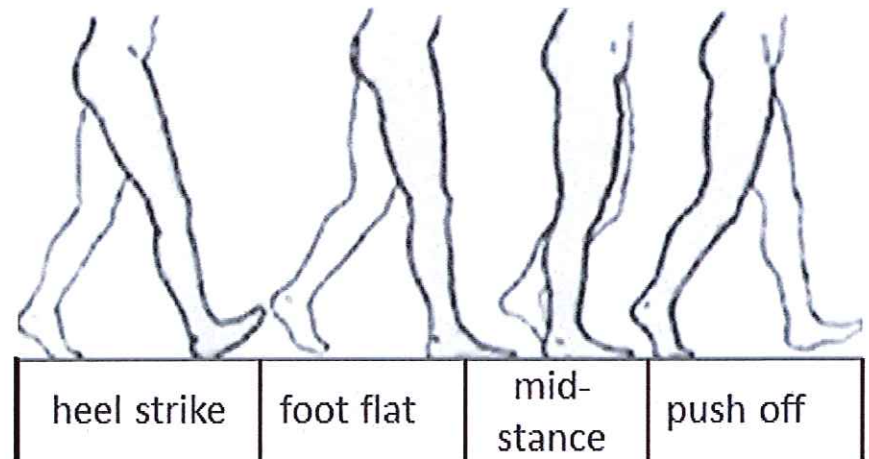

Amputee Locomotion

- Inefficient, slow, unstable walking
- Control challenges in new powered legs:

different control model
for every joint and phase

Nonlinear models to control legs

Patents pending

Application to Exoskeletons

Rehab exoskeletons move slowly and unnaturally to guarantee safety

Using a new virtual constraint, we have developed a controller that ensures robust stability, yet enables, fast, natural gait.

We are applying it to our UNB hip-knee-ankle exoskeleton

Clothespin Test

Requirement 1: Repeatability

Requirement 2: Separability

Control

Coapt: First commercialization of prosthetic pattern recognition

- Amazing time to be in the field
 - Transfer of engineering gadgets, control theory, psychophysical and experimental paradigms to end-users
- Great applications for exoskeletons, rehabilitation robots, and med-tech for an aging society
